

Active Directory - LDAP Section

In this section, we set up Active Directory using the LDAP protocol.

The screenshot shows the Configuration Manager interface. At the top, there is a blue header with "Configuration Manager" and "Configuration Manual". Below the header, there is a navigation bar with tabs: "Urls", "Licence", "Database", "Active Directory/OpenId", "App Logs", "Background Jobs", and "XFrame Settings". The "Active Directory/OpenId" tab is selected. Below the navigation bar, there are two sub-tabs: "Active Directory" (selected) and "OpenID". Under the "Active Directory" sub-tab, there is a section titled "LDAP Section" with a blue icon. Below this section, there are four checkboxes: "Active", "Login using Active Directory Groups relations only", "Automatic Login", and "Database Preference". There is also a checkbox for "False Login As Host". Below the checkboxes, there is a green button labeled "CHECK". At the bottom of the page, there is a blue footer with three buttons: "← ZPĚT", "CHECK ALL", and "SAVE SETUP & TERMINATE SERVER (AFTER THAT YOU MUST START SERVER AGAIN)".

- "Active" tells us if we want Infoport to work with AD.
- "Login using Active Directory Groups relations only" it is possible to set a ban on the login of a user who does not have an Active Directory group assigned.
- "Automatic Login" determines if users will automatically log into AD if they enter the Infoport URL in the browser.
- "Database Preference" tells us that when logging in, it goes to the database to the users first and then to AD
- "False Login As Host" allows us to choose if we want a user who is not in AD to be able to log in as a portal guest.
