

Installation of the Database to Save Enterprise Architect Model

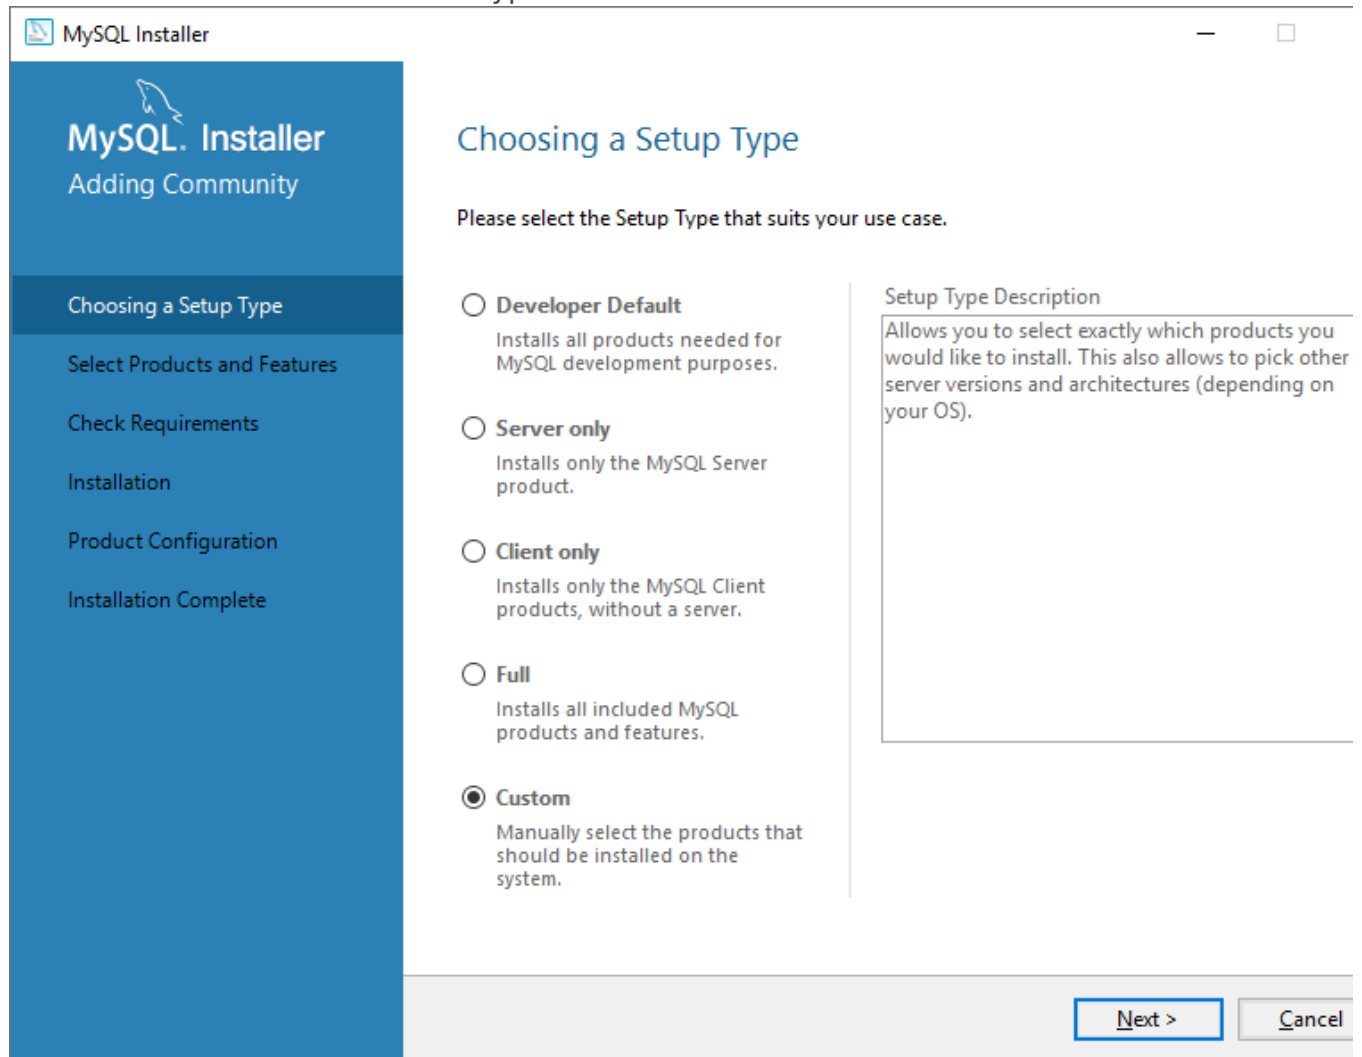

If a database engine is installed on the computer or available on the network, it is possible to skip this chapter.

Here you can learn how to install one of the supported database engines.

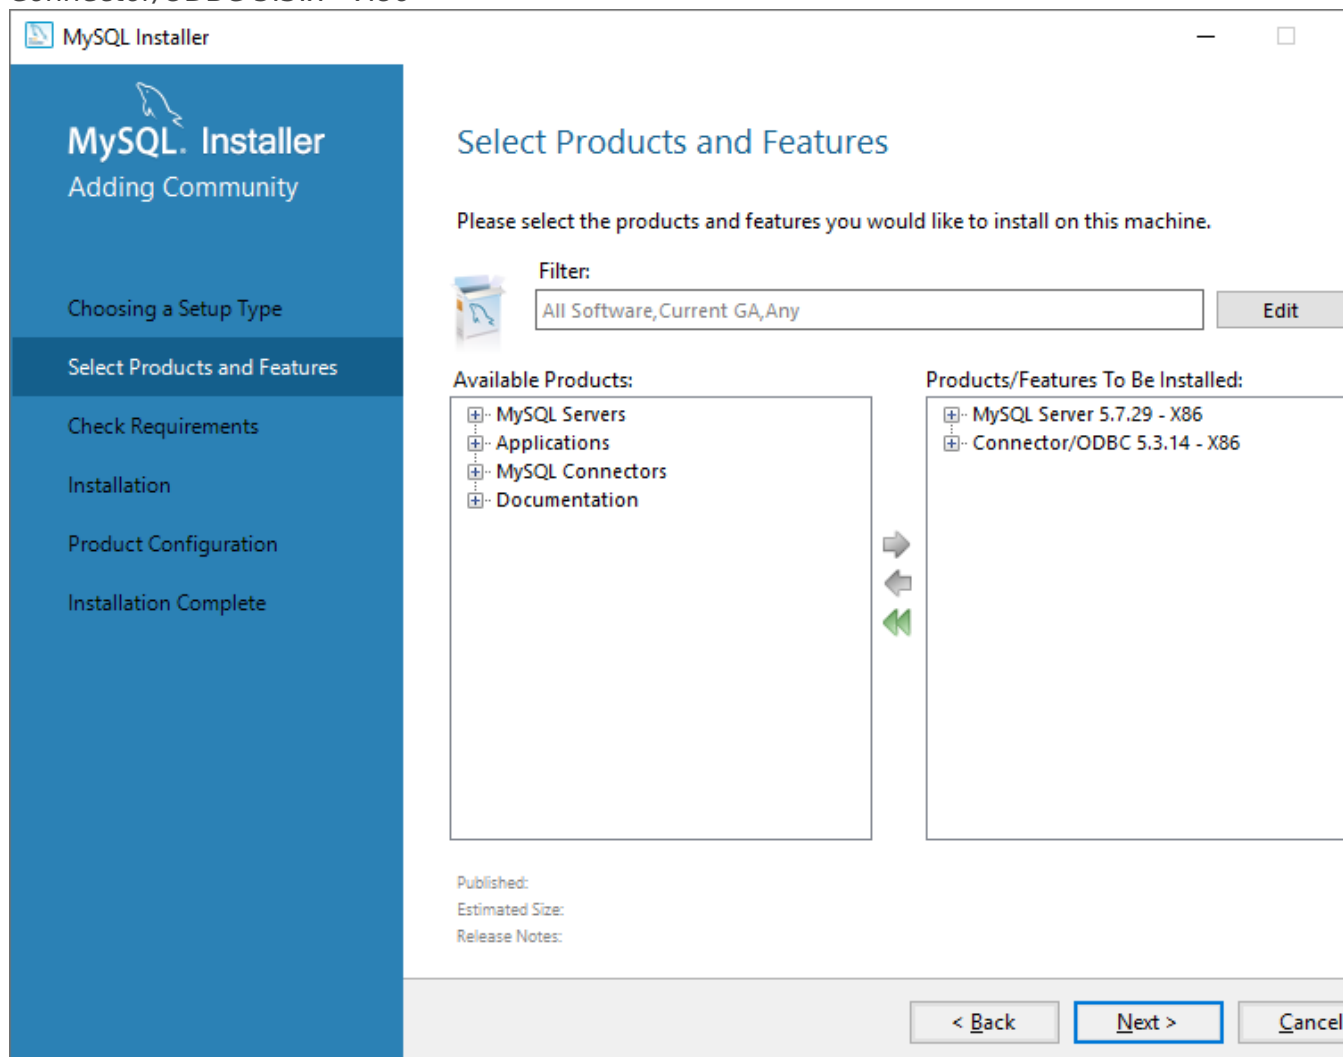

The one we're using is **MySQL**, which is recommended as ideal for the needs of both the Enterprise Architect program and EaInfoport

1. Before installing MySQL, it is necessary to ensure that the **vcredist_x86.exe** helper package in version 2013 is installed on the computer. Search the internet for "Visual C++ Redistributable Packages for Visual Studio 2013", save the vcredist_x86.exe variant to the disk and run it.
After approval of the licence, the package will be installed. There is no need to restart the computer. Delete the vcredist_x86.exe file
2. Download the 32-bit web installer for the 5.7.x series from
<https://downloads.mysql.com/archives/installer/>. So currently *mysql-installer-web-community-5.7.28.0.msi*
Save the file to the local disk (for example, to the C:\EAInfoport folder)
3. Run the file

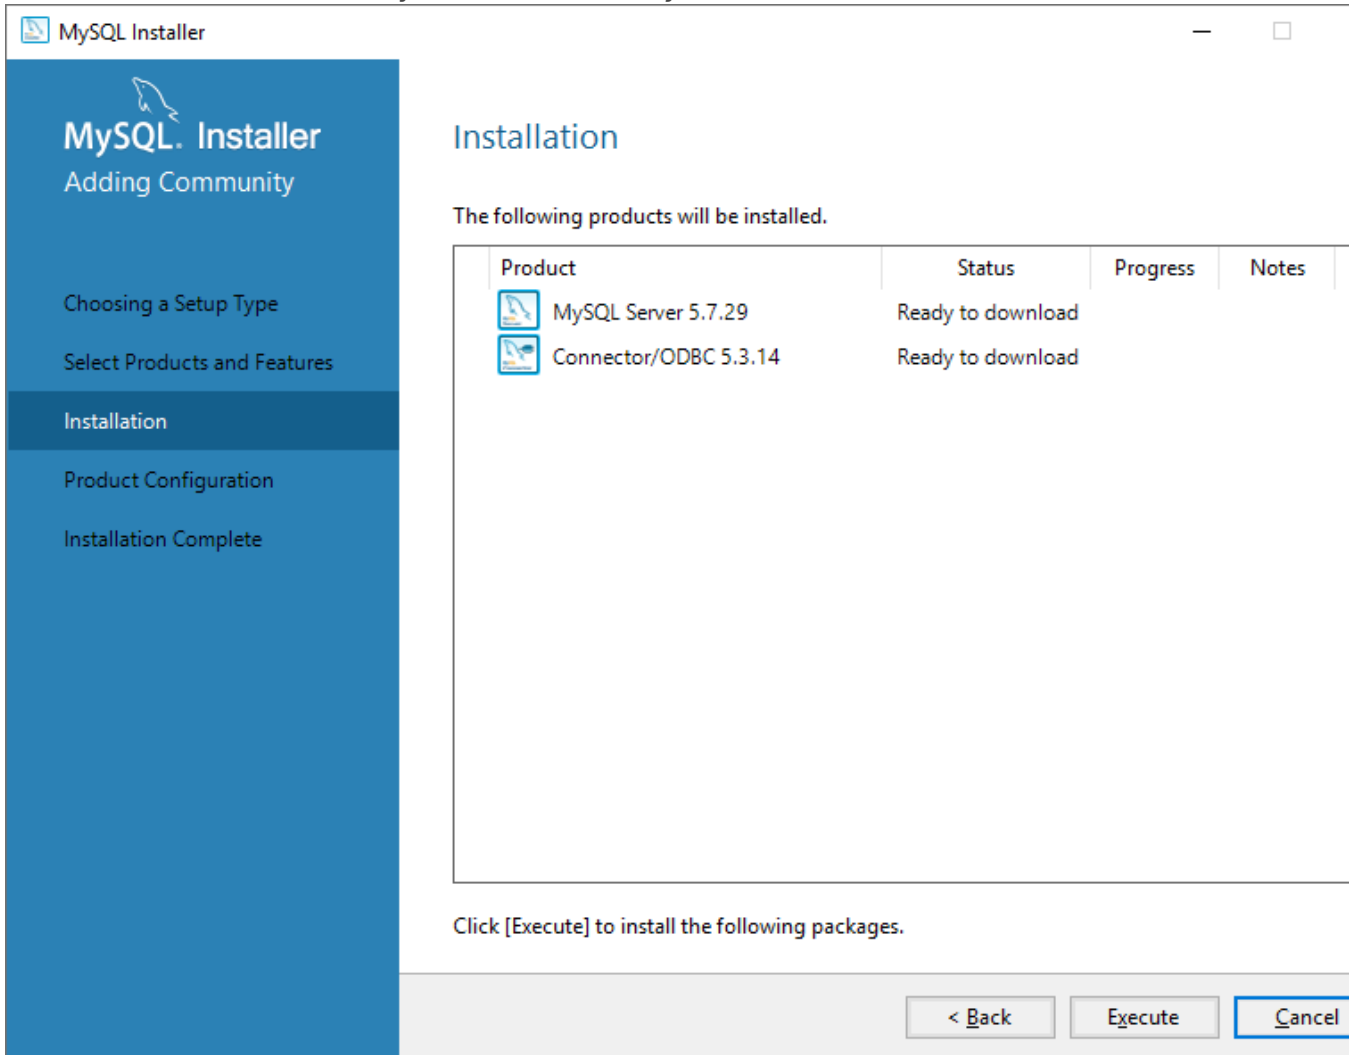

4. Select *Custom* as the installation type

5. Select two items to install:
MySQL Server 5.7.x - X86
Connector/ODBC 5.3.x - X86

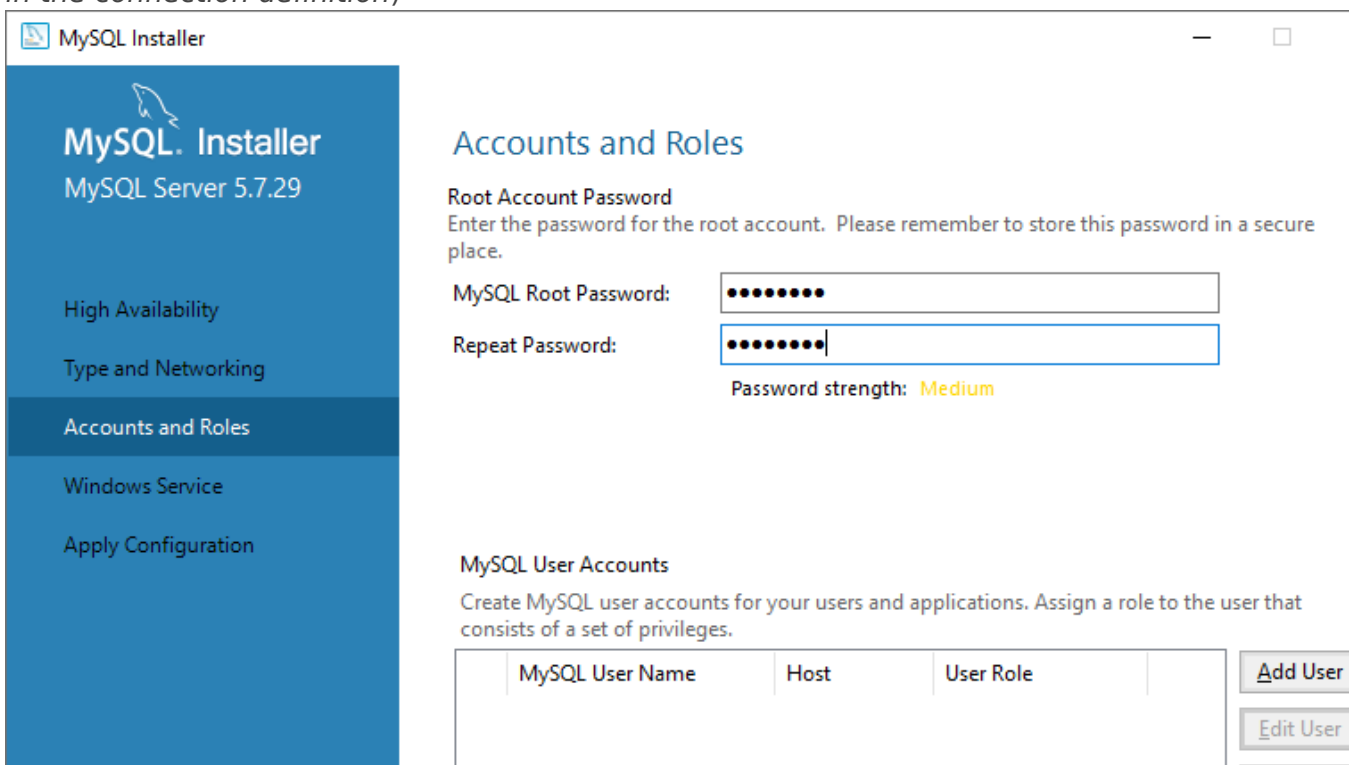

6. On the next tab, start the MySQL installation *MySQL*

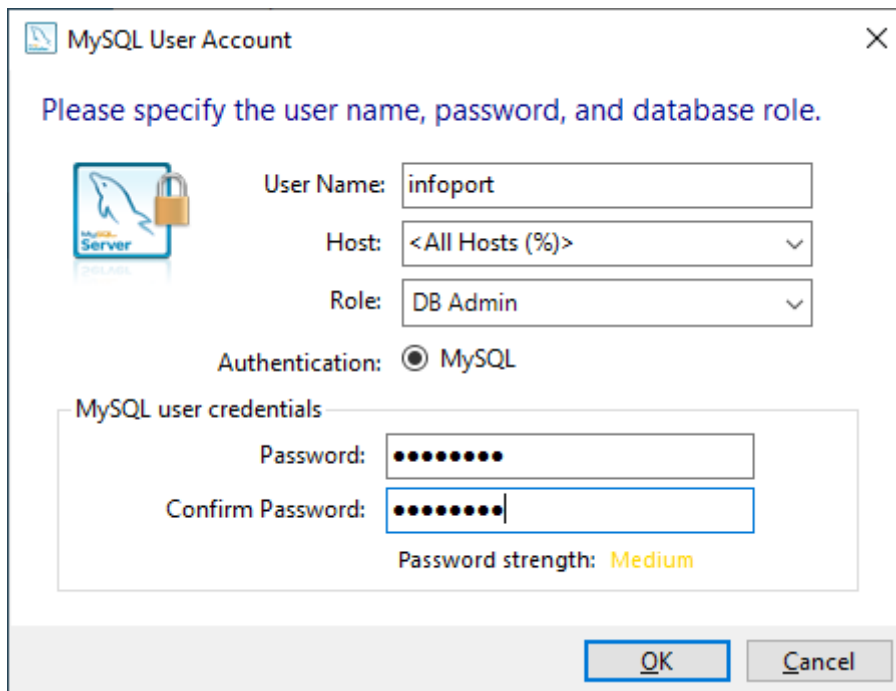

7. Leave the settings on the other tabs as default.

Only on the tab with the settings of accounts and roles, first fill in the root password (*for the database administrator*) and then create a user infoport, under which you will log into the database later.

All passwords (*mainly the administrator ones*) should be secure. For demonstration purposes, we use the phrase P@ssw0rd as a password in the manual. (*It will be seen later in the connection definition*)

The image shows a Windows-style dialog box titled "MySQL User Account" with a close button (X) in the top right corner. The main instruction reads "Please specify the user name, password, and database role." On the left side, there is a MySQL Server icon featuring a blue fish and a padlock. The form contains the following fields and controls:

- User Name:** A text box containing the value "infoport".
- Host:** A dropdown menu showing "<All Hosts (%)>".
- Role:** A dropdown menu showing "DB Admin".
- Authentication:** A radio button labeled "MySQL" is selected.
- MySQL user credentials:** A section containing:
 - Password:** A text box filled with 10 black dots.
 - Confirm Password:** A text box filled with 10 black dots.
 - Password strength:** A label showing "Medium" in yellow text.

At the bottom right, there are two buttons: "OK" (highlighted with a blue border) and "Cancel".

8. Delete the *mysql-installer-web-community-5.7.28.0.msi* installation file from the disk.
This completes the installation of the database and the ODBC driver (*but it will still need to be configured – see below*)
