

Trust Server Certificate

The screenshot shows the 'Configuration Manager' window with the 'Database' tab selected. The 'Infoport Database Connection' section is active, showing fields for DBMS Type (Microsoft SQL Server), Server (127.0.0.1), Port (1433), Database (infoport), User (admin), Password (masked), and Timeout (60). The 'Trust Server Certificate' checkbox is checked. A green 'CHECK' button is at the bottom left.

For EaInfoport version 8.8.0 and higher for the MSSQL database it is necessary to have a verified certificate.

In case of test versions, the requirement for this certificate can be disabled by setting:

Configuration Manager>Databases>Trust Server Certificate

If the configuration is not possible (Infoport will not start) then this can be set manually in appsetting.json by adding the parameter "TrustServerCertificate=True;" to the Connection string.

The setting must also be added to >Manage Repository>edit> EA Database Connection (this is not ODBC!) to all existing repositories.

If necessary, contact the helpdesk .
