Setting of Dynamic Detail

The dynamic detail setting allows the user to customize the visibility of various elements in the detail of an element, diagram, tab, etc. That is, which information (element name, description, element binding, tabs such as attributes, operations, bindings, etc.) should or should not be displayed, where they should be displayed, and what size they should be in the detail. For example, it's good to have the element description stretched as much as possible (over all slots), the version over one and the author name over three.

If the displayed text does not fit in the assigned size, it will be wrapped.

EA Infoport le already comes with a default field definition, it can be redefined at the repository, group or user level. The user can set the dynamic detail himself, or an admin can set it for him.

We have a choice:

- Setting of Dynamic Detail for Users
- Setting of Dynamic Detail for Groups
- Setting of Dynamic Detail for Repository
